Use 16 AWG wire to connect the left slot to ignition, the middle slot to constant 12V, and the right slot to ground. When the unit is connected in this way, it automatically powers up when the ignition is switched on and will stay on for a preconfigured amount of time (anywhere from 30 sec - 24 hrs) when the ignition is turned off.

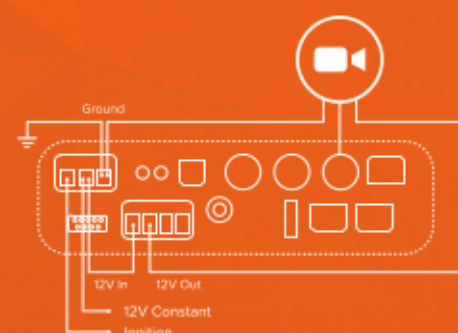

Once connected, turn on the ignition momentarily to power on the Eyeride. When the start-up process is completed successfully, the Power LED should display as a solid color and blink momentarily every second.

Since the EyeRide can be configured to stay on for up to 24 hours after the vehicle turns off, we need the cameras to be on the same power schedule as the EyeRide. Instead of connecting them to constant or ignition, power the cameras through the four-slot activator. This activator is a relay which will open when the EyeRide turns off cutting power to the cameras.

The GPS and AirCard antennas should be mounted high on the windshield for optimal connectivity.

When everything is connected properly, you should see the LED on the aircard blinking green. Please verify that the installation was completed successfully by contacting the EyeRide Technical Support Team at 954-775-1210. Alternatively, you can use the Live Chat feature on www.EyeRideOnline.com or send an email to support@eyerideonline.com

The DC200 and FD100 cameras have built in microphones. Make sure to connect them to the cables with built in audio jacks.
